

□ How options trading works □

☑ An option is a contract that gives every individual investor to buy & sell a stock at a specific price at a specific date. Call & Put are the 2 main parts of options trading. When a stock increases, decreases, or remains the same in value every buyer is placing a kind of bet on it that how much the price will deviate from its current price & at which time these changes occur & then by analyzing all parameters buyers enter into a contract where they can buy or sell any companies stock.

* Example-

Regardless of the share's real price on December 1, you can purchase 100 shares for 110 each. You have the option to buy Company X shares at a lower price on that day if they are trading for more than 110, allowing you to profit.
